**General Construction Specification:**  
(see detail below for full construction)

Main/Load Bearing::	152mm (nominal) Dense Concrete Core, $\lambda \leq 2.00$
Insulation:	2x 67mm layers of EPS + exterior extra 25mm, $\lambda = 0.036$
Cavity:	15mm Cavity behind Brick if present
Cladding:	9mm of Render OR 102mm Brick OR other Cladding

**Description:** PHPP only, ICF Wall, External Corner

**Reference:** E16 External Corner + 152mm extra EPS

## Junction Detail

Temperature Distribution

## Linear Thermal Transmittance W/m.K

$\Psi =$  -0.062

## Temperature Factor<sup>3</sup> for Humidity and Mould

$f =$  0.957

Calculation Prepared By: Matthew Wright MA Physics (Oxon) PGCE

**Notes:** Calculated for Passive House calculations only, not to be used for UK Building Regs & SAP

1.  $\Psi$  and  $f$  are only valid for the detail drawn and described above.
2. The  $\Psi$  and  $f$  quoted are considered valid for U-value(s) **Wall  $\leq 0.12$  W/m<sup>2</sup>.K**, (allowance of +/- 20%, following the present guidance from B. Anderson, BRE, correspondence dated 24/02/2012, for the UK market). The use of different claddings may affect the U-value slightly, but will have no material impact on the calculated values used here, in this case.
3. In dwellings, UK regulations stipulate that a temperature factor  $f$  that is  $>0.75$  would avoid the risk of mould growth. For other nations, jurisdictions and climates, please consult the local building regulations that apply for avoiding mould and condensation. (For example, typical requirements may be: Netherlands: 0.65; Switzerland: 0.75; Belgium: 0.7; Germany: 0.7; Finland: 0.87. French, German and other standards often do not indicate a single number for acceptable risk, but are dependent on circumstances.)
4. Calculations have been performed in accordance with:
  - EN ISO 10211\_2007 (British Standards)
  - IP 1/06 & BR497 (BRE Press)
 and with reference to the following publications:  
**EN ISO 6946** (British Standards)  
**BR443** (BRE Press)
